The goal of the GPSTk project is to provide a world class, open source computing suite to the satellite navigation community. It is our hope that the GPSTk will empower its users to perform new research and to create new applications.

GPS users employ practically every computational architecture and operating system. Therefore the design of the GPSTk suite is as platform-independent as possible. Platform independence is achieved through use of the ANSI-standard C++ programming language. The principles of object-oriented programming are used throughout the GPSTk code base in order to ensure that the code is modular, extensible, and maintainable.

The GPSTk suite consists of a core library and a set of applications. The library provides a wide array of functions that solve processing problems associated with GPS such as processing or using RINEX. The library is the basis for the more advanced applications distributed as part of the GPSTk suite.

The GPSTk is sponsored by Space and Geophysics Laboratory, within the Applied Research Laboratories at the University of Texas at Austin (ARL:UT). GPSTk is the by-product of GPS research conducted at ARL:UT since before the first satellite launched in 1978; it is the combined effort of many software engineers and scientists. In 2003 the research staff at ARL:UT decided to open source much of their basic GPS processing software as the GPSTk.

# Part I Theory

## Chapter 1

# The Global Positioning System in a Nutshell

The Global Positioning System is actually a U.S. government satellite navigation system that provides a civilian signal. As of this writing, the signal is broadcast simultaneously by a constellation of 29 satellites each with a 12 hour orbit. From any given position on the Earth, 8 to 12 satellites are usually visible at a time.

#### 1.1 GPS in a Nutshell

Each satellite broadcasts spread spectrum signals at 1575.42 and 1227.6 MHz, also known as L1 and L2, respectively. Currently the civil signal is broadcast only on L1. The signal contains two components: a time code and a navigation message. By differencing the received time code with an internal time code, the receiver can determine the distance, or range, that the signal has traveled. This range observation is offset by errors in the (imperfect) receiver clock; therefore it is called a pseudorange. The navigation message contains the satellite ephemeris, which is a numerical model of the satellite's orbit.

GPS receivers record, besides the pseudorange, a measurement called the carrier phase (or just phase); it is also a range observation like the pseudorange, except (1) it has an unknown constant added to it (the phase ambiguity) and (2) it is much smoother (about 100 times less measurement noise than the pseudorange!), which makes it useful for precise positioning. Because of the way it is measured, the phase is subject to random, sudden jumps; these discrete changes always come in multiples of the wavelength of the GPS signal, and are called cycle slips.

#### 1.1.1 The Position Solution

The standard solution for the user location requires a pseudorange measurement and an ephemeris for each satellite in view. At least four measurements are required as there are four unknowns: 3 coordinates of position plus the receiver clock offset. The basic algorithm for the solution is described in the official GPS Interface Control Document, or ICD-GPS-200. The position solution is corrupted due to two sources of error: errors in the observations and errors in the ephemeris.

#### Reducing Measurement Errors

The GPS signal travels through every layer of the Earth's atmosphere. Each layers affects the signal differently. The ionosphere, which is the high-altitude, electrically charged part of the atmosphere, introduces a delay, and therefore a range error, into the signal. The ionosphere delay can be predicted using a model. However, the accuracy of ionosphere models is limited. A better alternative is to measure and remove the ionosphere delay. Measurement of the ionosphere delay is possible by taking advantage of the fact that the delay is frequency dependent. It can be directly computed if you have data on both the GPS frequencies. There is also a delay due to the troposphere, the lower part of the atmosphere. Like the ionosphere delay, the atmosphere delay can be either predicted or derived from measurements. There are many other errors associated with the GPS signal: multipath reflections and relativistic effects are two examples.

More precise applications reduce the effect of error sources by a technique referred to as differential GPS (DGPS). By differencing measurements simultaneously collected by the user and a nearby reference receiver, the errors that are common to both receivers (most of them) are removed. The result of DGPS positioning is a position relative to the reference receiver; adding the reference position to the DGPS solution results in the absolute user position.

The alternative to DGPS is to explicitly model and remove errors. Creating new and robust models of phenomena that effects the GPS signal is an area of active research at ARL:UT and other laboratories. The positioning algorithm can be used to explore such models. Essentially, the basic approach is to turn the positioning algorithm inside out to look at the corrections themselves. For example, observations from a network of receivers can create a global map or model of the ionosphere.

#### Improved Ephemeredes

The GPS position solution can be directly improved by using an improved satellite ephemeris. The U.S National Geospatial-Intelligence Agency (NGA) generates and makes publicly available a number of precise ephemeredes, which are more accurate satellite orbits [?], [?]. Satellite orbits described by the broadcast navigation message have an error on the order of meters; the precise ephemeris has decimeter accuracy. The International GPS Service (IGS) is a global, civil cooperative effort that also provides free precise ephemeris products [?]. Global networks of tracking stations produce the observations that make generation of the precise ephemeredes possible.

#### 1.2 GPS Data Sources

GPS observation data from many tracking stations are freely available on the Internet. Many such stations contribute their data to the IGS. In addition, many networks of stations also post their data to the Internet; for example the Australian Regional GPS Network (ARGN) [?] and global cooperatives such as NASA's Crust Dynamics Data Information System (CDDIS) [?].

#### 1.2.1 GPS File Formats

Typically GPS observations are recorded in a standardized format developed by and for researchers. Fundamental to this format is the idea that the data should be independent of the type of receiver that collected it. For this reason the format is called Receiver INdependent Exchange, or RINEX. Another format associated with GPS is SP-3, which records the precise ephemeris. The GPSTk supports both RINEX and SP-3 formats.

#### 1.2.2 Receiver Protocols

GPS receivers have become less expensive and more capable over the years, in particular handheld and mobile GPS receivers. The receivers have many features in common. All of the receivers output a position solution every few seconds. All receivers store a list of positions, called waypoints. Many can display maps that can be uploaded. Many can communicate with a PC or handheld to store information or provide position estimates to plotting software.

Typically communication with a PC and other system follows a standard provided by the National Marine Electronics Association called NMEA-0183. NMEA-0183 defines an ASCII based format for communication of position solutions, waypoints and a variety of receiver diagnostics. Here is an example of a line of NMEA data, or sentence:

#### \$GPGLL,5133.81,N,00042.25,W\*75

The data here is a latitude, longitude fix at 51 deg 33.81 min North, 0 deg 42.25 min West; the last part is a checksum.

As a public standard, the NMEA-0183 format has given the user of GPS freedom of choice. NMEA-0183 is the format most typically used by open source applications that utilize receiver-generated positions.

Closed standards are also common. SiRF is a proprietary protocol that is licensed to receiver manufacturers. Many receiver manufacturers implement their own binary protocols. While some of these protocols have been opened to the public, some have been reverse engineered.

#### 8 CHAPTER 1. THE GLOBAL POSITIONING SYSTEM IN A NUTSHELL

## Chapter 2

# **GPS** File Formats

A variety of file formats are supported within the GPSTk. The file formats generally store GPS observation data or data related to processing of GPS observables. In this section, a summary of the file formats supported within the GPSTk is presented along with a brief rationale of why each format is supporting within the GPSTk and where to find additional information on the format.

#### 2.1 RINEX

The Receiver INdependent EXchange (RINEX) format was developed by the National Geodetic Survey (NGS) in the U.S. and the University of Berne in Switzerland. RINEX is actually three format definitions that allow storage of GPS observations, GPS navigation message information, and meteorological data associated with GPS observations. GPSTk contains classes to both read and write RINEX V2.1 data files of all types (observation, navigation message, and meteorological). RINEX has undergone a number of revisions since its inception. Each revision is defined using a standard [?], [?], [?], [?].

#### 2.2 FIC

The Floating, Integer, Charater (FIC) format was developed in the mid-80s as a relatively machine-independent way to store GPS observation and navigation message data while retaining receiver specific characteristics. Over time, the RINEX format (see above) proved more popular with users and use of the observation records within the FIC format faded away. However, the FIC records associated with GPS navigation message data are still supported within the GP-STk because these records retain some data quantities that are not contained within the RINEX navigation message file. For example, RINEX makes few provisions for storing the almanac data contained in Subframe 4 and Subframe 5. Like RINEX, a standards document defines FIC [?].

## 2.3 SP-3

The SP-3 format stores ephemeris information for satellites. Usually SP-3 is used for storage of GPS precise ephemerides. GPSTk supports both SP-3a and SP3-c formats. SP-3 was originally designed by NGS. Standards documents describe the specific details of the SP-3 formats [?], [?].

# Part II Usage, Examples & Notes

	Tool	Description	Execution Example
	calgps	generates a GPS calendar	calgps -Y 2004
$\Gamma$ ransforms	poscvt	converts a given input position to other position formats	poscvtgeodetic="30.28 262.26700 167.64"
Trans	timeconvert	converts given input time to other time formats	timeconvertcalendar="07 04 2006"
_	wheresat	outputs expected location of a satellite	wheresat -b arl2100.06n -p 3
ing	rtAshtech	records observations from an Ashtech receiver	rtAshtech -p /dev/ttyS1 -o "minute%03j%02H%02m.%06yo"
nvert	ficfica ficafic fic2rin	convert fic files between ASCII, binary, and RINEX formats	fic2rin fic2100.06 rin121.06n
သိ	mdp2fic mdp2rinex	convert MDP files to FIC or RINEX files	mdp2rinex -i mdpfile -o arl2100.06o
ing &	novaRinex	convert Novatel files to RINEX	novaRinexinput nova2100.06 obstype L1
Collecting & Converting	navdmp	dumps information from nav files to human readable formats	navdmp -i arl2100.06n -o arl2100.06.dmp
ŭ	RinexDump	dumps observation data for specified satellites from a RINEX file	RinexDump ar12100.06o 3 4 L1 L2
	ephdiff	compares the satellite positions from two ephemeris sources	ephdiff ar12100.06n fic2100.06
1g	ficdiff	compares contents of two FIC files	ficidff fic12100.06 fic22100.06
Comparing & Validating	ficcheck ficacheck	reads a FIC file and checks it for errors reporting the first found	ficcheck fic2100.06 -t "07/20/2006 11:00:00"
Val	rowdiff rnwdiff rmwdiff	compares contents of two RINEX files	rowdiff arl1210.06o arl22100.06o

Table 2.1: GPSTk Applications, categorized, with execution examples.

## $2.4 \quad ash2mdp \ ash2xyz$

#### 2.4.1 Overview

These applications process Ashtech Z(Y)-12 observation and ephemeris data and output satellite positions and ionospheric corrections in either MDP or XYZ format.

#### 2.4.2 Usage

		ash2mdp ash2xyz
Optional	Arguments	
Short Arg	. Long Arg.	Description
-i		Where to get data from. The default is to use stdin.
-O		Where to send the output. The default is to use stdout.
-d	-debug	Increase debug level.
-v	-verbose	Increase verbosity.
-h	-help	Print help usage.
-w	-week=NUM	The full GPS week in which this data starts.
-c	-code=ARG	Use this option when the start time of the data being processed is not during this week.  Restriction for source of observation data collected via L1/L2 Y code tracking will be used. Options are "Y", "P", and "codeless."
-S	-offset $=$ NUM	XYZ only.  Output SV positions at a time offset from the current time. Give a positive or negative integer of seconds. XYZ only.
-n	-num_points=NUM	Width of the exponential filter moving window, in number of points (default is 36). XYZ only.

#### 2.4.3 Notes

Input is on the command line, or of the same format in a file (-f < file >).

2.5. ATS2MDP 15

# $2.5 \quad ats2mdp$

## 2.5.1 Overview

This application converts ATS binary format data to MDP format.

## 2.5.2 Usage

ats2mdp							
Optional Arguments							
Short Arg.	Long Arg.	Description					
-d	-debug	Increase debug level.					
-v	-verbose	Increase verbosity.					
-h	-help	Print help usage.					
-i	-input = ARG	A file from which to take the input. The default					
-O	-output=ARG	is stdin. A file from which to receive the output. The default is stdout.					

# $2.6 \quad bc2sp3$

## 2.6.1 Overview

This application reads RINEX navigation file(s) and writes to SP3 (a or c) file(s).

## 2.6.2 Usage

bc2sp3					
Optional A	Arguments				
Short Arg.	Long Arg.	Description			
	-in	Read the input file (repeatable).			
	-out	Name the output file. Default is sp3.out.			
	$-\mathbf{t}\mathbf{b}$	Output beginning epoch; $\langle \text{time} \rangle = \text{week}$ ,			
		sec-of-week (earliest in input).			
	-te	Output ending epoch; $\langle \text{time} \rangle = \text{week}$ ,			
		sec-of-week (latest in input).			
	-output $C$	Output version c (no correlation) (otherwise a).			
	-msg	Add message as a comment to the output			
		header (repeatable).			
	-verbose	Output to screen: dump headers, data, etc.			
	$-\mathrm{help}$	Print this message and quit.			

2.7. CALCDOPS 17

#### CalcDOPs2.7

#### 2.7.1Overview

This application reads SV almanac data (one file per day of observation) from a FIC, FICA or a RINEX navigation file, then computes and displays visibility information. Dilution of precision values from that data are calculated using standard methods. See for example:

- AIAA GPS Theory and Applications vol. 1, Ed. Parkinson & Spilker, pp.
- GPS Signals, Measurements, and Performance, 2ed., Misra & Enge, pp. 203.

#### 2.7.2Usage

Calc	

		CalcDOPs
Required Arguments Short Argi <inputfile></inputfile>	Long Arg.	Description Input file for day to be calculated.
Optional Arguments		
-p <inputfile></inputfile>		Input file for previous day (ephemeris mode only).
-o <outputfile></outputfile>		Grid output file (default DOPs.out).
-sf <outputfile></outputfile>		Stats output file (default DOPs.stat).
-tf <outputfile></outputfile>		Time steps output file (default DOPS.times).
-l <outputfile></outputfile>		Log output file (default DOPS.log).
-rs		Read from stats file.
-a		Work in almanac mode (ephemeris mode is default).
-w -s < week > < sow >		Starting time tag.
-x <prn></prn>		Exclude satellite PRN.
-t <dt></dt>		Time spacing.
-na		North America only.
-d		Dump grid results at each time step
		(time-intensive).
-h	$-\mathrm{help}$	Output options info and exit.
-V		Print version info and exit.

#### 2.7.3 Notes

#### Abort/failure codes given on return:

	, ,
-1	could not open input data file
-2	could not identify input data file type
-3	fewer than 4 satellite almanacs available
-4	could not allocate GridStats data types
-5	could not open input stats file
-6	could not open output grid file
-7	could not open output stats file
-8	could not open output log file

#### Essential variables not documented below at declaration:

NtrofN	number of cells/times with < 5 SVs visible during the time period
NpeakH	number cells/times w/ HDOP $> 10$
NpeakP	number cells/times w/ PDOP $> 10$
IworstN	index in Grid of cell with worst nsvs (number of satellites)
IworstH	index in Grid of cell with worst HDOP
IworstP	index in Grid of cell with worst PDOP
WorstN	value of nsvs at IworstN
WorstH	value of HDOP at IworstH
WorstP	value of PDOP at IworstP
TworstN	time tag (CommonTime class) of WorstN
TworstH	time tag (CommonTime class) of WorstH
TworstP	time tag (CommonTime class) of WorstP

- 1. GPS only, using PRNs hard-wired to SV numbers 1-32.
- $2.\,$  Elevation limit is hard-wired to 5 degrees above horizion.
- 3. "North America" means the northern half-hemisphere: -180 to 0 deg long., 0 to 90N latitude.
- 4. Ephemeris mode is default, almanac mode is optional. Ephemeris mode is preferred, because it excludes unhealthy satellites for any time when they transmitted an unhealthy flag. Almanac mode will generally not exclude SVs when they were unhealthy (typical), or may erroneously exclude them for an entire day (rarely).
- 5. If 2 input files are given, the default start time is midnight on the day to be calculated. A previous-day input file can be given only in ephemeris mode, not almanac.
- 6. The code uses geodetic coordinates for all calculations.
- $7.\,$  The -d option is useful for e.g. making movies of DOPs throughout a day.

2.8. CALGPS 19

## 2.8 calgps

#### 2.8.1 Overview

This application generates a dual GPS and Julian calendar to either the command line or to a graphics file. The arguments and format are inspired by the UNIX 'cal' utility. With no arguments, the current argument is printed. The last and next month can also be printed. Also, the current or any given year can be printed.

#### 2.8.2 Usage

Optional A	Arguments	
Short Arg.	Long Arg.	Description
-h	-help	Generates help output.
-3	-three-months	Prints a GPS calendar for the previous, current, and next month.
-y	-year	Prints a GPS calendar for the entire current year.
-Y	-specific-year=NUM	Prints a GPS calendar for the entire specified year.
-p	-postscript=ARG	Generates a postscript file.
-s	-svg = ARG	Generates an SVG file.
-e	-eps=ARG	Generates an encapsulated postscript file.
-v	-view	Try to launch an appropriate viewer for the file.
-n	-no-blurb	Suppress GPSTk reference in graphic output.

#### 2.8.3 Examples

```
> calgps -3
```

```
Jun 2011
1638
                           1-152 2-153 3-154 4-155

```

#### 2.8.4 Notes

If multiple options are given only the first is considered.

## $2.9 \quad compSatV is \ compStaV is$

#### 2.9.1 Overview

compSatVis computes satellite visibility. compStaVis computes station visibility.

#### 2.9.2 Usage

#### $compSatVis\ compStaVis$

	1	Sat Vie compora Vie
Required A	Arguments	
Short Arg.	Long Arg.	Description
-O	-output-file=ARG	Name of the output file to write.
-n	-nav = ARG	Name of navigation file.
-c	-mscfile=ARG	Name of MS coordinates file.
Optional A	Arguments	
Short Arg.	Long Arg.	Description
-d	-debug	Increase debug level.
-v	-verbose	Increase verbosity.
-h	-help	Print help usage.
-p	-int = ARG	Interval in seconds.
-e	-minelv = ARG	Minimum elevation angle.
-t	-navFileType=ARG	FALM, FEPH, RNAV, YUMA, SEM, or SP3.
-m	-min-sta = ARG	Minimum number of stations visible
		simultaneously. compStaVis only.
-m	-max-SV=ARG	Maximum number of SVs tracked
		simultaneously. compSatVis only.
-D	-detail	Print SV count for each interval.
-x	-exclude = ARG	Exclude station.
-i	-include = ARG	Include station.
-s	-start-time=TIME	Start time of evaluation ("m/d/y H:M").
-z	-end-time $=$ TIME	End time of evulation ("m/d/y H:M").

#### 2.9.3 Examples

#### Generating satellite visibility statistics using the SEM almanac from the USCG Navigation Center.

This example loads SEM almanac data from the file current.al3 and a list of station locations from the file stations.msc. It then calculates the number of satellites visible to each station found at each 60 sec interval from 0000Z to 2356Z of Jan 13, 2008. using a 10 degree minimum elevation angle. The results are written to the file visout.txt. Note the use of a specific start time. The SEM and Yuma almanac formats contain an almanac reference week, which is generally in the range 0-1023 (the existing format definitions are ambiguous and SEM and Yuma almanacs with full week numbers have been reported, at least anecdotally). If the -s command is not specified, compSatVis will use whatever reference time is given in the almanac file, which may result in unexpected results.

user@host:~\$ compSatVis -ovisout.txt -ncurrent.al3 -tSEM -cstations.msc -e10 -p60 -s"01/16/2008 00:00"

# Generating station visibility statistics using the SEM almanac from the USCG Navigation Center.

Same as the previous example, however, the values calculated and the statistics will reflect the number of stations visible to each satellite.

user@host:~\$ compSatVis -ovisout.txt -ncurrent.alm -tYUMA -cstations.msc -e10 -p60 -s"01/13/20

#### Generating satellite visibility statistics using the Yuma almanac from the USCG Navigation Center.

Similar to the first example, but the statistics are computed over four complete days.

user@host:~\$ compSatVis -ovisout.txt -ncurrent.alm -tYUMA -cstations.msc -e10 -p60 -s"01/13/20

#### Generating satellite visibility statistics using SP3 files.

Similar to the first example, however, navigation message data are from three SP3 files. It is necessary to load three SP3 files to cover the default sidereal day period because the methods that calculate SV positions from the SP 3 data use interpolation and need data from the previous day and the following day in order to have sufficient points for the interpolation. In this example in which no evaluation period is specified, compSatVis derives coverage for the "middle day" for the period.

user@host:~\$ compSatVis -ovisout.txt -napc14622 -napc14623 -napc14624 -tSP3 -cstations.msc -e

#### $2.10 \quad Constellation List$

#### 2.10.1 Overview

ConstellationList provides lists of the GPS SV PRN ID active/inactive on a given day.

#### 2.10.2 Usage

Constellation List			
Required A	Arguments		
Short Arg.	Long Arg.	Description	
-i	-input-file = < arg >	The name of the Constellation Definition file(s)	
		to read.	
-y	-year = <arg></arg>	Year of interest.	
-y -j	-day-of-year = <arg></arg>	Day of year.	
Optional A	rguments		
Short Arg.	Long Arg.	Description	
-d	-debug	Increase debug level.	
-v	-verbose	Increase verbosity.	
-h	-help	Print help usage.	
-O	-OpsAd	Assume input file is Op Advisory format (CSV	
		is default).	
-b	-Base24	List PRNs in Base 24 Constellation.	
-x	-excessSVs	List PRNs in use, but in excess of the Base 24	
		Constellation.	
-n	-notBase24	List PRNs NOT used in Base 24 Constellation.	
-s	-SVN Output	Output SVN in place of PRN (not valid for -O).	

#### 2.10.3 Examples

```
>ConstellationList -iSlot2008.csv -tC -y2008 -j001 -b
2, 3, 4, 6, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 27, 28, 30, 31
>ConstellationList -iSlot2008.csv -tC -y2008 -j001 -n
1, 5, 7, 24, 25, 26, 29, 32
>ConstellationList -iSlot2008.csv -tC -y2008 -j001 -n
1, 5, 24, 25, 26
>ConstellationList -iSlot2008.csv -tC -y2008 -j001 -b -s
61, 33, 34, 36, 38, 39, 40, 46, 58, 43, 41, 55, 56, 53, 54, 59, 51, 45, 47, 60, 27, 44, 30, 52
```

#### 2.10.4 Notes

In particular, ConstellationList provides a means of determining which SVs are members of the "Base 24" constellation and which are not. This is usually of no interest to the general user, but is important in cases where programs are evaluating GPS performance against a defined standard such at the Standard Positioning Service (SPS) Performance Standard (PS) which defines GPS performance in terms of the "official" constellation as opposed to the superset which is normally available. The results are provided as a text list of comma separated values on a a single line, suitable for piping into another process.

The complication in this process is that the information regarding the orbit plane/slot of each SV is not available from the broadcast message. It must be obtain "external to the system". Once source of such information is the USCG Navigation Center website which store the Operational Advisories. These advisories provide the relationship between SVs and plane/slot assignments. ConstellationList is programmed to read the advisories as an input format, as long as the format of the advisories does not change.

As an alternative to the Operational Advisories, ARL:UT has prepared files of the assignments for specific years as comma separated value files. Each line in these files represents the status on a given day and includes the mapping between the PRN IDs and the NAVSTAR numbers. These files have been hand-checked and are available in the GPSTk repository as Slot2007.csv and Slot2008.csv.

## 2.11 daa

## 2.11.1 Overview

This application performs a data availability analysis of the input data. In general, availability is determined by station and satellite position.

### 2.11.2 Usage

daa			
Required .	Arguments		
Short Arg.	Long Arg.	Description	
-e	-eph=ARG	Where to get the ephemeris data. Acceptable	
		formats include RINEX nav, FIC, MDP, SP3,	
		YUMA, and SEM. Repeat for multiple files.	
-O	-obs=ARG	Where to get the observation data. Acceptable	
		formats include RINEX obs, MDP, smooth,	
		Novatel, and raw Ashtech. Repeat for multiple	
		files. If a RINEX obs file is provided, the	
		position will be taken from the header unless otherwise specified.	
Ontional /	Arguments	otherwise specified.	
Short Arg.	Long Arg.	Description	
-d	-debug	Increase debug level.	
-v	-verbose	Increase verbosity.	
-h	-help	Print help usage.	
	-ouput=ARG	Output location (default is stdout).	
-x	-independent=ARG	The independent variable in the analysis. The	
	•	default is time.	
-c	-msc = ARG	Station coordinates file.	
-m	-msid=ARG	Station for which to process data. Used to select	
		a station position from the msc file.	
-t	-time-format = ARG	CommonTime format specifier used for times in	
		the output. The default is "%Y %j	
		%02H:%02M:%04.1f".	
	-mask-angle=ARG	Ignore anomalies on SVs below this elevation.	
	4 1 1 ADC	The default is 10 degrees.	
	-track-angle=ARG	Assume the receiver starts tracking at this	
	-time-mask=ARG	elevation. The default is 10 degrees.  Ignore anomalies on SVs that haven't been	
	-time-mask=AnG	above the mask angle for this number of	
		seconds. The default is 0 seconds.	
	-snr=ARG	Discard data with an SNR less than this value.	
	5111-71100	The default is 20 dB-Hz.	
-p	-position=ARG	Receiver antenna position in position (x,y,z)	
	1	coordinates. Format as a string: "X Y Z".	
-l	-time-span=ARG	How much data to process, in seconds.	
	-ignore-prn=ARG	Specify the PRN of an SV to not report on in	
		the output. Repeat to specify multiple SVs.	
	-obs-interval=ARG	Specify the time interval, in seconds, between	
		observations. The default is to scan the file to	
,	1 11 11	discover this via examination of the file.	
-b	-bad-health	Ignore anomalies associated with SVs that are	
	ama a ala a ali +	marked unhealthy.	
-S	-smash-adjacent	Combine adjacent lines from the same PRN.	

2.11. DAA 25

-start-time=TIME Ignore data before this time.
-stop-time=TIME Ignore any data after this time.

## $2.12 \quad DiscFix$

#### 2.12.1 Overview

This application reads a RINEX observation data file containing GPS dual-frequency pseudorange and carrier phase measurements, divides the data into 'satellite passes', and finds and fixes discontinuities in the phases for each pass.

Output is a list of editing commands for use with program EditRinex. DiscFix will (optionally) write the corrected pseudorange and phase data to a new RINEX observation file. Other options will also smooth the pseudorange and/or debias the corrected phase.

DiscFix calls the GPSTk Discontinuity Corrector (GDC vers  $5.3\ 7/14/2008$ ).

#### 2.12.2 Usage

		DiscFix
Required A	Arguments	
Short Arg.	Long Arg.	Description
	$-{ m inputdir}$	File containing more options.
	-dt	Time space in seconds of the data.
Optional A	Arguments	
Short Arg.	Long Arg.	Description
-f	-file	File containing more options.
	-beginTime	Start time of processing (BOF).
	-endTime	End time of processing (EOF).
	-decimate	Decimate data to specified time interval, in
	C CA	seconds.
	-forceCA	Use C/A code range, NOT P code. Default only
		if P absent.
	–gap	Minimum data gap in seconds separating
	onlyCat	satellite passes (600). Process only satellite (GPS SatID, e.g. G21).
	-onlySat -exSat	Exclude satellite(s) (GPSSatID).
	-exsat -smoothPR	Smooth pseudorange and output in place of raw
	-smoothi it	pseudorange.
	$-\mathrm{smoothPH}$	Debias phase and output in place of raw phase.
	-smooth	Same as -smoothPR AND -smoothPH.
	-DClabel	Set Discontinuity Corrector parameter 'label' to 'value'.
	-DChelp	Print a list of GDC parameters and their
		defaults, then quit.
	-logOut	Output log file name (df.log).
	$-\mathrm{cmdOut}$	Output file name, for editing commands
		(df.out).
	-format	Output time format (gpstk::CommonTime)
		(%4F %10.3g).
	-RinexFile	RINEX (obs) file name for output of corrected
	DunDu	data. RINEX header 'RUN BY' string for output.
	–RunBy –Observer	RINEX header 'OBSERVER' string for output.
	-Observer -Agency	RINEX header 'AGENCY' string for output.
	-Agency -Marker	RINEX header 'MARKER' string for output.
	MIGINEI	THINDA header MARKETT String for output.

2.12. DISCFIX 27

-Number RINEX header 'NUMBER' string for output.

-h —help Print this syntax page and quit.

-verbose Print extended output to the log file.

## 2.12.3 Examples

> DiscFix --dt 1.5 --inputfile ar12800.06o

DiscFix, part of the GPS ToolKit, Ver 5.0 8/20/07, Run 2011/07/22 11:17:25 DiscFix is writing to log file df.log DiscFix is writing to output file df.out DiscFix timing: 0.960 seconds.

## 2.13 DOP calc

## 2.13.1 Overview

This application computes position, time, and geometric dilution of precision (DOP) parameters.

### 2.13.2 Usage

		DOP calc
Required .	Arguments	
Short Arg.	Long Arg.	Description
-e	-eph=ARG	Where to get the ephemeris data. Acceptable formats include RINEX nav, FIC, MDP, SP3, YUMA, and SEM. Repeat for multiple files.
-0	-obs=ARG	Where to get the observation data. Acceptable formats include RINEX obs, MDP, smooth, Novatel, and raw Ashtech. Repeat for multiple files. If a RINEX obs file is provided, the position will be taken from the header unless otherwise specified.
Optional A	Arguments	•
Short Arg.	Long Arg.	Description
-d	-debug	Increase debug level.
-v	-verbose	Increase verbosity.
-h	-help	Print help usage.
-p	-position=ARG	User position in ECEF (x,y,z) coordinates. Format as a string: "X Y Z".
	-el-mask=ARG	Elevation mask to apply, in degrees. The default is 0.
-c	-msc=ARG	Station coordinate file.
-m	-msid=ARG	Monitor station ID number.

29

#### 2.14 EditRinex

#### 2.14.1 Overview

This application will open and read one RINEX file, apply editing commands, and write the modified RINEX data to another RINEX file(s). Input is on the command line, or of the same format in a file (-f<file>).

#### 2.14.2 Usage

		EditRinex
Optional A	Arguments	
Short Arg.	Long Arg.	Description
-f	-file <file></file>	File containing more options.
-l	$-\log < file >$	Output log file name.
-h	-help	Print syntax and quit.
-d	-debug	Print extended output info.
-v	-verbose	Print extended output info.
	<REC $>$	Rinex editing commands - following:

#### **Rinex Editor Commands**

Commands consist of an identifier and a comma-delimited data field; they may be separated by space(s) '-id <data>' (two minuses) or not '-id <data>' (one minus).

Examples are '–IF myFile' or '-IFmyFile'; '–HDc msg' or '–HD cmsg' or '-HDcmsg'; –BZ or -BZ; '–DD +<SV,OT,t>' or '–DD+ <SV,OT,t>' or '–DD+<SV,OT,t>'.

The data field contains no whitespace and sub-fields are comma-delimited. <SV> is a RINEX 'system and id' identifier, e.g. G27 (= GPS PRN 27); satellite system alone denotes 'all satellites this system', e.g. 'R' (GLONASS). <OT> is a RINEX observation type, e.g. L1 or P2, and is case sensitive. <time> is either <GPSweek,GPSsecOfWeek> or <year,mon,day,hour,min,second>. File I/O:

## Output RINEX header:

<sup>-</sup>IF<file> Input RINEX observation file name [may be repeated] (required).

<sup>-</sup>ID<dir> Directory in which to find input file.

<sup>-</sup>OF<file> Output RINEX file name (required, or -OF<file>,<time>).

<sup>-</sup>OF<f>,<time> At RINEX epoch <time>, close output file and open another named <f>.

<sup>-</sup>OD<dir> Directory in which to put output file(s).

<sup>-</sup>HDf If present, fill optional records in the output RINEX header

<sup>-</sup>HDpprogram> Set output RINEX header 'program' field.

<sup>-</sup>HDr<run\_by> Set output RINEX header 'run by' field.

<sup>-</sup>HDo<observer> Set output RINEX header 'observer' field.

- -HDa<agency> Set output RINEX header 'agency' field.
- -HDx<x,y,z> Set output RINEX header 'position' field to ECEF position (x,y,z).
- -HDm<marker> Set output RINEX header 'marker' field.
- -HDn<number> Set output RINEX header 'number' field.
- -HDc<comment> Add comment to output RINEX header (more than one allowed).
- -HDdc Delete all comments in output RINEX header.
- (NB -HDdc cannot delete comments created by \*subsequent\* -HDc commands).

Output RINEX observation types (also see 'Specific edit commands' below):

- -AO<OT> Add observation type OT to header and observation data.
- -DO<OT> Delete observation type OT entirely (including in header).

#### Time-related edit commands:

- -TB<time> Begin time: reject data before this time (also used for decimation).
- -TE<time> End time: reject data after this time.
- -TT<dt> Tolerance in comparing times, in seconds (default=1ms).
- -TN<dt> Decimate data to epochs = Begin + integer\*dt (within tolerance).

#### Specific edit commands:

(Generally each '+' command (e.g DA+<time>) has a corresponding '-' command, and viceversa; if not, end-of-file or beginning-of-file is assumed. Note that one-time commands are applied AFTER other commands of the same type.)

#### Delete commands:

- -DA+<time> Delete all data beginning at this time.
- -DA-<time> Stop deleting data at this time.
- -DO<OT> Delete observation type OT entirely (including in header).
- -DS<SV> Delete all data for satellite SV entirely (SV may be system only).
- -DS<SV>,<time> Delete all data for satellite SV at this single time only.
- -DS+<SV>,<time> Delete all data for satellite SV beginning at this time.
- -DS-<SV>,<time> Stop deleting all data for satellite SV at this time.
- -DD<SV,OT,t> Delete a single RINEX datum (SV,OT,t) at time  $<\!$ t>.
- -DD+<SV,OT,t> Delete all (SV,OT) data, beginning at time <t>.
- -DD-<SV,OT,t> Stop deleting all (SV,OT) data at time <t>.
- (Deleting data for one OT means setting it to zero as RINEX requires.)

#### Set commands:

- -SD < SV, OT, t, d > Set data(SV, OT, t) to < d > at time < t >.
- -SS<SV,OT,t,s> Set ssi(SV,OT,t) to <s> at time <t>.
- -SL+<SV,OT,t,l> Set all lli(SV,OT,t) to  $<\!\!l>$  at time  $<\!\!t>\!\!.$
- -SL- $\langle SV,OT,t,l \rangle$  Stop setting lli(SV,OT,t) to  $\langle l \rangle$  at time  $\langle t \rangle$  (', $\langle l \rangle$ ' is optional).
- -SL<SV, OT,t,l> Set lli(SV,OT,t) to <l> at the single time <t> only.

2.14. EDITRINEX 31

#### Bias commands:

(BD commands apply only when data is non-zero, unless -BZ appears.)

- -BZ Apply BD commands even when data is zero (i.e. 'missing').
- -BD<SV,OT,t,d> Add the value of <d> to data(SV,OT,t) at time <t>.
- -BD+<SV,OT,t,d> Add value <d> to data(SV,OT) beginning at time <t>.
- -BD-<SV,OT,t,d> Stop adding <d> to data(SV,OT) at time <t> (',<d>' optional).
- -BS<SV,OT,t,s> Add the value of  $<\!\!\mathrm{s}\!\!>$  to  $\mathrm{ssi}(\mathrm{SV},\!\mathrm{OT},\!\mathrm{t})$  at time  $<\!\!\mathrm{t}\!\!>$  .
- -BL<SV,OT,t,l> Add the value of <l> to lli(SV,OT,t) at time jt>.

## 2.14.3 Examples

Changing the APPROX position in the file acor1480.080 to the center of the Earth. Writes a new file called acor1480.080.mod

user@host:~\$ EditRinex -IFacor1480.08o -OFacor1480.08o.mod -HDx0,0,0

Removing a satelite, PRN 29, from an observation file, onsa2240.05o. Creates a new file, temp.o  $\,$ 

EditRinex -IFonsa2240.05o -OFtemp.o

# $2.15 \quad ephdiff$

## 2.15.1 Overview

The application compares the contents of two files containing ephemeris data.

## 2.15.2 Usage

		ephdiff
Optional A	Arguments	
Short Arg.	Long Arg.	Description
-d	-debug	Increase debug level.
-v	-verbose	Increase verbosity.
-h	-help	Print help usage.
-f	-fic=ARG	Name of an input FIC file.
-r	-rinex=ARG	Name of an input RINEX NAV file.

## 2.15.3 Examples

```
> ephdiff -f fic06.187 -r arl2800.06n
Broadcast Ephemeris (Engineering Units)

#### 2.15.4 Notes

Both files can either be a RINEX or a FIC file.

2.16. EPHSUM 33

# $2.16 \quad ephsum$

#### 2.16.1 Overview

ephsum summarizes contents of a RINEX navigation message or FIC file and outputs to text file. The summary contains the transmit time, time of effectivity, end of effectivity, IODC, and health as a one-line-per ephemeris summary. The number of ephemerides found per SV is also provided. The number of ephemerides per SV is also summarized at the end. The default is to summarize all SVs found. If a specific PRN ID is provided, only data for that PRN ID will be summarized.

#### 2.16.2 Usage

```
ephsum
Required Arguments
Short Arg.
             Long Arg.
                                  Description
             -input-file=ARG
-i
                                  Input file name(s).
             -output-file=ARG
                                  Output file name.
-0
Optional Arguments
Short Arg.
             Long Arg.
                                  Description
                                  Increase debug level.
-d
             -debug
                                  Increase verbosity.
-v
             -verbose
-h
             -help
                                  Print help usage.
             -PRNID=ARG
                                  The PRN ID of the SV to process (default is all
-p
                                  SVs).
                                  List in order of transmission (default is TOE).
             -xmit
-x
```

# 2.18 ficacheck ficcheck

#### 2.18.1 Overview

These applications read input ASCII or binary FIC and check them for errors. ficcheck checks binary files and ficacheck checks ASCII files.

## 2.18.2 Usage

#### **Optional Arguments** Description Short Arg. Long Arg. -d -debug Increase debug level. -verbose Increase verbosity. Print help usage. -h -help $-time{=}TIME$ -t Time of first record to count (default BOT). -end-time=TIME End of time range to compare (default EOT).

ficacheck usage: ficacheck [options] <FICA file>
ficcheck usage: ficcheck [options] <FIC file>

#### **2.18.3** Examples

```
>ficcheck fic06.187
Checking fic06.187
Read 252 records.
```

#### > ficacheck brokenfica

#### 2.18.4 Notes

Only the first error in each file is reported. The entire file is always checked regardless of time options.

# 2.19 ficafic ficfica

#### 2.19.1 Overview

These applications convert navigation message data between variations of the FIC format, a format for GPS observations established by ARL:UT. *ficacheck* works with ASCII FIC files and *ficcheck* works with binary FIC files.

#### 2.19.2 Usage

```
ficafic usage: ficafic <input fica file> <output fic file name> ficfica usage: ficfica <input fic file> <output fica file name>
```

#### **2.19.3** Examples

```
File Snippets
```

# 2.20 ficdiff

## 2.20.1 Overview

The application compares the contents of two FIC files containing ephemeris data.

# 2.20.2 Usage

$\mathit{ficdiff}$			
Optional Arguments			
Short Arg.	Long Arg.	Description	
-d	-debug	Increase debug level.	
-v	-verbose	Increase verbosity.	
-h	-help	Print help usage.	
-t	-time=TIME	Start of time range to compare (default BOT).	
-e	-end-time=TIME	End of time range to compare (default EOT).	

ephdiff usage: ficdiff [options] fic1 fic2

## 2.20.3 Examples

```
> ficdiff -t "08/01/2006 12:00:00" fic1 fic2
<FIC BlockNumber: 9
  floats: 139 362 172806 1 1 1386 1 0 0 55296 0 -4.19095e-09 180000 0 . . .
integers:

```

# $2.21 \quad find More Than 12$

# 2.21.1 Overview

This application finds when there are simultaneously more than 12 SVs above a given elevation.

# 2.21.2 Usage

av,
ites.
above
at a

#### 2.22 IonoBias

#### 2.22.1 Overview

The application will open and read several preprocessed RINEX observation files (containing obs types EL,LA,LO,SR or SS) and use the data to estimate satellite and receiver biases and to compute a simple ionospheric model using least squares and the slant TEC values.

#### 2.22.2 Usage

IonoBias	

 $\begin{array}{ccc} \textbf{Required Arguments} \\ \textbf{Short Arg.} & \textbf{Long Arg.} & \textbf{Description} \\ & -\text{input} & \textbf{Input RINE} \end{array}$ 

Input RINEX obs file name(s).

Optional Arguments

 ${\bf Short\ Arg.} \quad {\bf Long\ Arg.} \quad {\bf Description}$ 

-f

File containing more options

 $-input dir \qquad Path \ for \ input \ file(s).$ 

Ephemeris Input

Short Arg. Long Arg. Description

 $-navdir \qquad \ \, Path \,\, of \,\, navigation \,\, file(s).$ 

-nav Navigation (RINEX (nav) OR SP3) file(s).

Output

Short Arg. Long Arg. Description

-datafile Data (AT) file name, for output and/or input.

-log Output log file name.

-biasout Output satellite+receiver biases file name.

Time Limits

Short Arg. Long Arg. Description

-BeginTime Start time, arg is of the form YYYY,MM,DD,HH,Min,Sec.

-BeginGPSTime Start time, arg is of the form GPSweek,GPSsow.

-EndTime End time, arg is of the form

YYYY,MM,DD,HH,Min,Sec.

-EndGPSTime End time, arg is of the form GPSweek,GPSsow.

Processing

Short Arg. Long Arg. Description

-NoEstimation Do NOT perform the estimation (default=false).
-NoPreprocess Skip preprocessing; read (existing) AT file

(false).

-NoSatBiases Compute Receiver biases ONLY (not Rx+Sat

biases) (false).

-Model Ionospheric model: type is linear, quadratic or

cubic.

-MinPoints
 -MinTimeSpan
 Minimum points per satellite required.
 Minimum timespan per satellite required

(minutes).

2.22. IONOBIAS 41

```
-MinLatitude
                                  Minimum latitude (degrees).
              -MaxLatitude
                                  Maximum latitude (degrees).
              -MinLongitude
                                  Minimum longitude (degrees).
              -MaxLongitude
                                  Maximum longitude (degrees).
              -Time Sector \\
                                  \label{time sector} \mbox{Time sector (day $--$ night $--$ both)}.
              -TerminOffset\\
                                  Terminator offset (minutes).
                                  Ionosphere height (km).
              -IonoHeight
Other Options
Short Arg.
             Long Arg.
                                  Description
              -XSat
                                  Exclude this satellite (<sat> may be <system>
                                  only).
                                  Print extended output info.
              -verbose
                                  Increase debug level.
              -debug
```

Print syntax and quit.

Minimum elevation angle (degrees).

```

#### 2.22.4Notes

Input can be either on the command line or put in a file and then input using the -f option. The file is formatted just as if it were the command line.

# 2.23 mdp2fic mdp2rinex

## 2.23.1 Overview

The applications convert a variety of GPS related observations from the MDP format to FIC and RINEX formats. MDP is a format for network receiver interfaces derived by ARL:UT that can be used to serve observations over networks.

## 2.23.2 Usage

mdp2fic			
Required A	f Arguments		
Short Arg.	Long Arg.	Description	
-i	-mdp-input = ARG	Filename to read MDP data from. The filename	
		of '-' means to use stdin.	
-n	-nav=ARG	Filename to which FIC nav data will be written.	
Optional A	Arguments		
Short Arg.	Long Arg.	Description	
-d	-debug	Increase debug level.	
-v	-verbose	Increase verbosity.	
-h	-help	Print help usage.	
-l	-log=ARG	Filename for (optional) output log file.	
		mdp2rinex	
Required A	Arguments		
Short Arg.	Long Arg.	Description	
-i	-mdp-input=ARG	Filename to read MDP data from. The filename	
		of '-' means to use stdin.	
-n	-obs=ARG	Filename to write RINEX obs data to. The	
		filename of '-' means to use stdout.	
Optional A	Arguments		
Short Arg.	O	Description	
-d	-debug	Increase debug level.	
-v	-verbose	Increase verbosity.	
-h	-help	Print help usage.	
-n	-nav=ARG	Filename to write RINEX nav data.	
-p	-pos=ARG	Antenna position to write into obs file header.	
-	_	Format as string: "X Y Z"	
-t	-thinning=ARG	A thinning factor for the data, specified in	
	-	seconds between points.	
-c	-12c	Enable output of L2C data in C2.	
-a	-any-nav-source	Accept subframes from any code/carrier.	

## 2.23.3 Examples

```
> mdp2fic -i mdp183.06 -o fic183.06 -l mdp2ficlog183.06
```

<sup>&</sup>gt; mdp2rinex -i mdp183.06 -o rin183.060 -n rin183.06n -t 60

2.24. MDPTOOL 43

# $2.24 \quad mdptool$

# 2.24.1 Overview

The application performs various functions on a stream of MDP data.

# 2.24.2 Usage

mdptool			
Optional Arguments			
Short Arg.	Long Arg.	Description	
-d	-debug	Increase debug level.	
-v	-verbose	Increase verbosity.	
-h	-help	Print help usage.	
-i	-input = ARG	Where to get the MDP data from. The default	
		is to use stdin. If the file name begins with	
		"tcp:" the remainder is assumed to be a	
		hostname[:port] and the source is taken from a	
		tcp socket at this address. If the port number is	
		not specified a default of 8910 is used.	
	-output=ARG	Where to send the output. The default is	
		stdout.	
-p	-pvt	Enable pvt output.	
-O	-obs	Enable obs output.	
-n	-nav	Enable nav output.	
-t	-test	Enable selftest output.	
-X	-hex	Dump all messages in hex.	
-b	-bad	Try to process bad messages also.	
-a	-almanac	Build and process almanacs. Only applies to the	
		nav style.	
-е	-ephemeris	Build and process engineering ephemerides.	
		Only applies to the nav style.	
	-min-alm	This allows a complete almanac to be	
		constructed from fewer than 50 pages. It is	
		required for Ashtech $Z(Y)$ -12. The default is to	
c	C 11	require all 50 pages.	
-f	-follow	Follow the input file as it grows.	
-S	-output-style=ARG		
		stream. Valid styles are: brief, verbose, table,	
		track, null, mdp, nav, and summary. The	
		default is summary. Some modes aren't quite	
1	time Community	complete.	
-l	-timeSpan=NUM	How much data to process, in seconds.	
-m	-bug-mask=NUM	What RX bugs: 1 SV count, 2 nav parity/fmt, 4	
	-startTime=TIME	HOW/hdr time equal. Ignore data before this time.	
	-start rime-rime	ignore data before this time. $(\%4Y/\%03j/\%02H:\%02M:\%05.2f)$ .	
	-stopTime=TIME	Ignore any data after this time.	
	-time-format=ARG	CommonTime format specifier used for times in	
	ome-ioimat—Aug	the output. The default is %4Y %3j	
		%02H:%02M:%04.1f.	
		,00=11,00=111,00 1:11.	

## 2.24.3 Notes

In the summary mode, the default is to only summarize the obsservation data above 10 degrees. Increasing the verbosity level will also summarize the data below 10 degrees.

2.25. MERGEFIC 45

# $2.25 \quad mergeFic$

# 2.25.1 Overview

This application merges multiple FIC files into a single FIC file.

# 2.25.2 Usage

		mergeFIC
Required A	Arguments	
Short Arg.	Long Arg.	Description
-i	-input = ARG	An input RINEX observation file, can be
		repeated as many times as needed.
-O	-output=ARG	Name for the merged output RINEX
		observation file. Any existing file with that
		name will be overwritten.
Optional Arguments		
Short Arg.	Long Arg.	Description
-d	-debug	Increase debug level.
-v	-verbose	Increase verbosity.
-h	-help	Print help usage.

# 2.25.3 Examples

> mergeFIC -i fic1 -i fic2 -o ficm

# $2.26 \quad mergeRinObs\ mergeRinNav\ mergeRinMet$

## 2.26.1 Overview

These applications merge multiple RINEX observation, navigation, or meteorological data files into a single coherent RINEX obs/nav/met file, respectively.

# 2.26.2 Usage

		mergeRinObs
Required A	Arguments	
Short Arg.	Long Arg.	Description
-i	-input = ARG	An input RINEX observation file, can be
		repeated as many times as needed.
-O	-output=ARG	Name for the merged output RINEX
		observation file. Any existing file with that
		name will be overwritten.
Optional A	Arguments	
Short Arg.	Long Arg.	Description
-d	-debug	Increase debug level.
-v	-verbose	Increase verbosity.
-h	-help	Print help usage.

mergeRinNav and mergeRinMet have the same usage.

## 2.26.3 Examples

```
> mergeRinObs -i arl280.06o -i arl2810.06o -o arl280-10.06o
> mergeRinNav -i arl280.06n -i arl2810.06n -o arl280-10.06n
> mergeRinMet -i arl280.06m -i arl2810.06m -o arl280-10.06m
```

2.27. NAVDMP 47

# $2.27 \quad navdmp$

## 2.27.1 Overview

The application prints the contents of an FIC or RINEX navigation file into a human readable file and allows filtering of the data.

## 2.27.2 Usage

navdmp			
Required A	Arguments		
Short Arg.	Long Arg.	Description	
-i	-input = ARG	Name of an input navigation message file.	
-O	-output = ARG	Name of an output file.	
Optional A	Arguments		
Short Arg.	Long Arg.	Description	
-d	-debug	Increase debug level.	
-v	-verbose	Increase verbosity.	
-h	-help	Print help usage.	
-a	-all-records	Unless otherwise specified, use default values for record filtration.	
-t	-time = TIME	Start time (of data) for processing.	
-e	-end-time=TIME	End time (of data) for processing.	
-p	-prn=NUM	PRN(s) to include.	
-b	-block=NUM	FIC block number(s) to process ((9)109	
-r	-RINEX	(Engineering) ephemerides, (62)162 (engineering) almanacs). Assume input file is a RINEX navigation message file.

2.28. NAVMERGE

49

# 2.28 NavMerge

## 2.28.1 Overview

The application merges RINEX navigation files into a single file.

#### 2.28.2 Usage

NavMerge					
Optional A	rguments				
Short Arg.	Long Arg.	Description			
-О		Write all data to an output RINEX nav file. If omitted, a data summary is written to the			
		screen.			
-tb		Output only if epoch is within 4 hours of the			
		interval (tb,te).			
-te		If te or tb is missing, they are made equal. Time			
		tags have the form year,mon,day,HH,min,sec			
		OR GPSweek,sow.			

NavMerge usage: NavMerge [options] <RINEX nav file> <RINEX nav file>

## 2.28.3 Examples

> NavMerge -o s081213-214.99n s081213a.99n s081214a.99n

```
Output file name is
Exception: text 0:Unexpected EOF
text 1:In record 0
text 2:In file s081213-214.99n
text 3:Near file line 0
location 0:src/FFTextStream.hpp:244
location 1:src/FFStream.cpp:159
location 2:src/FFStream.hpp:208
location 3:src/FFStream.hpp:208
Read 0 ephemerides from file s081213-214.99n
Read 200 ephemerides from file s081213a.99n
Read 197 ephemerides from file s081214a.99n
```

#### 2.28.4 Notes

Read 397 total ephemerides.

NavMerge corrects data for output when the GPS full week number is inconsistent with the epoch time.

# $2.29 \quad navsum$

#### novaRinex2.30

#### 2.30.1Overview

The application will open and read a binary Novatel file (OEM2 and OEM4 receivers are supported), and convert the data to RINEX format observation and navigation files. The RINEX header is filled using user input (see below), and optional records are filled.

## 2.30.2 Usage

novaRinex					
Short Arg.	Arguments Long Arginput	Description Novatel binary input file.			
_	Arguments				
Short Arg. -f	Long Arg.	Description Name of file containing more options ('#' to EOL : comment).			
	-dir	Directory in which to find input file (default ./).			
	-obs	RINEX observation output file (RnovaRINEX.obs).			
	-nav	RINEX navigation output file (RnovaRINEX.nav).			
Output R	INEX Heade	r Fields			
Short Arg.		Description			
	-noHDopt	If present, do not fill optional records in the			
	***	output RINEX header.			
	–HDp	Set output RINEX header 'program' field			
1	HDr	('novaRINEX v2.1 9/07').  Set output RINEX header 'run by' field			
	шы	('ARL:UT/GPSTk').			
-]	HDo <obser></obser>	Set output RINEX header 'observer' field.			
-]	HDa <agency></agency>	-			
-]	HDm <marker></marker>	, ,			
-]	HDn < number>	> Set output RINEX header 'number' field.			
	HDrn < number				
	HDrt <type></type>	Set output RINEX header 'Rx type' field ('Novatel').			
-]	HDrv <vers></vers>	Set output RINEX header 'Rx version' field ('OEM2/4').			
-]	HDan < number	> Set output RINEX header 'antenna number' field.			
	HDat <type></type>	Set output RINEX header 'antenna type' field.			
-]	HDc <comment< th=""><th>&gt; Add comment to output RINEX header (&gt;1 allowed).</th></comment<>	> Add comment to output RINEX header (>1 allowed).			
Output RINE	Output RINEX Observation Data				
		Description			

# O: Sh

Long Arg.	Description
-obstype $<$ OT $>$	Output this RINEX (standard) obs type (i.e.
	<ot> is one of L1,L2,C1,P1,P2,D1,D2,S1,or</ot>
	S2); repeat for each type. NB default is ALL
	std. types that have data.
	Long Argobstype <ot></ot>

Output Co	put Configuration		
Short Arg.	Long Arg.	Description	
	-begin < arg >	Start time, arg is of the form	
		YYYY,MM,DD,HH,Min,Sec.	
	-beginGPS <arg></arg>	Start time, arg is of the form GPSweek, GPSsow.	
	-end < arg >	End time, arg is of the form	
		YYYY,MM,DD,HH,Min,Sec.	
	-endGPS < arg >	End time, arg is of the form GPSweek, GPSsow	
	-week <week></week>	GPS Week number of this data, NB: this is for OEM2; this command serves two functions, resolving the ambiguity in the 10-bit week (default uses –begin, –end, or the current system time) and ensuring that ephemeris records that precede any obs records are not lost.	
	-debias	Remove an initial bias from the phase.	
-h	-help	Print this message and quit.	
	-verbose	Print more information.	
-d	-debug	Print extended output info.	

## 2.30.3 Notes

Input is on the command line, or of the same format in a file (-f < file >).

# $2.31 \quad poscvt$

## 2.31.1 Overview

This application allows the user to convert among different coordinate systems on the command line. Coordinate systems handled include Cartesian, geocentric, and geodetic.

## 2.31.2 Usage

		poscvt				
Optional Arguments						
Short Arg.	Long Arg.	Description				
-d	-debug	Increase debug level.				
-v	-verbose	Increase verbosity.				
-h	-help	Print help usage.				
	-ecef=POSITION	ECEF "X Y Z" in meters.				
	-geodetic=POSITION	Geodetic "lat lon alt" in deg, deg, meters.				
	-geocentric=POSITION	Geocentric "lat lon radius" in deg, deg, meters.				
	-spherical=POSITION	Spherical "theta, pi, radius" in deg, deg, meters.				
-l	-list-formats	List the available format codes for use by the				
		input and output format options.				
-F	-output-format=ARG	Write the position with the given format.				

# 2.31.3 Examples

> poscvt --ecef="4345070.59253 45619878.26297 803.598856837"

```
ECEF (x,y,z) in meters 4345070.5925 45619878.2630 803.5989
Geodetic (llh) in deg, deg, m 0.00100566 84.55926933 39448197.4795
Geocentric (llr) in deg, deg, m 0.00100472 84.55926933 45826334.4795
Spherical (tpr) in deg, deg, m 89.99899528 84.55926933 45826334.4795
```

## 2.31.4 Notes

If no options are given poscvt assumes XYZ 0 0 0.

2.32. PRSOLVE 55

# 2.32 PRSolve

## 2.32.1 Overview

The application reads one or more RINEX observation files, plus one or more navigation (ephemeris) files, and computes an autonomous pseudorange position solution, using a RAIM-like algorithm to eliminate outliers. Output is to the log file, and also optionally to a RINEX observation file with the position solutions in auxiliary header blocks.

## 2.32.2 Usage

#### PRSolve

		PRSolve			
	Required Arguments				
Short Arg.	Long Arg.	Description			
-O	-obs	Input RINEX observation file(s).			
-n	-nav	Input navigation (ephemeris) file(s) (RINEX or			
0 1 .		SP3).			
	rguments: In	=			
Short Arg.	Long Arg.	Description			
-f		File containing more options.			
	-obsdir	Directory of input observation file(s).			
	-navdir	Directory of input navigation file(s).			
	-metdir	Directory of input meteorological file(s).			
-m	-met	Input RINEX meteorological file(s).			
	-decimate	Decimate data to time interval dt.			
	-BeginTime	Start time: arg is 'GPSweek,sow' OR			
		'YYYY,MM,DD,HH,Min,Sec'.			
	-EndTime	End time: arg is 'GPSweek,sow' OR			
		'YYYY,MM,DD,HH,Min,Sec'.			
	-useCA	Use C/A code pseudorange if P1 is not available.			
	-forceCA	Use C/A code pseudorange regardless of P1			
		availability.

-ReturnAtOnce
 -NReject
 -NIter
 Return as soon as a good solution is found.
 Maximum number of satellites to reject.
 Maximum iteration count (linearized LS

algorithm).

-Conv Minimum convergence criterion (m) (LLS

algorithm).

Optional Arguments: Output

Short Arg. Long Arg. Description

-Log Output log file name (prs.log).

-PosXYZ < X,Y,Z> Known position (ECEF,m), used to compute

output residuals.

-APSout Output autonomous pseudorange solution (APS

- no RAIM).

-TimeFormat Output time format (ala CommonTime)

(default: %4F %10.3g).

Optional Arguments: RINEX Output

Short Arg. Long Arg. Description

-outRinex
 -RunBy
 Output RINEX header 'RUN BY' string.
 -Observer
 Output RINEX header 'OBSERVER' string.
 -Agency
 Output RINEX header 'AGENCY' string.
 -Marker
 Output RINEX header 'MARKER' string.
 -Number
 Output RINEX header 'NUMBER' string.

Optional Arguments: Help

Short Arg. Long Arg. Description

-verbose
 -debug
 -helpRetCodes
 Print extended output.
 Print very extended output.
 Print return codes (implies -help).

-h —help Print syntax and quit.

## 2.34 reszilla

#### 2.34.1 Overview

Reszilla is an application that computes various residuals from GPS pseudorange, phase, and doppler data. These data are often referred to as raw observations. The two types of residuals that are currently computed are an Observed Range Deviation (ORD), and a double difference (DD). Once these residuals are computed, statistical summaries of these differences are computed and output to the user. Optionally, the residuals themselves may be output.

#### 2.34.2 Observed Range Deviations

An ORD is basically the observed range to an SV differenced from the estimated range to that SV. There are many terms that go into computing the estimated range and/or correcting the observed range for known effects. When all of these effects are accounted for (as reszilla is capable of doing) ORDs can be in the 10-30 cm range for a geodetic quality GPS receiver. Pretty impressive when you consider that the range to the SV is somewhere between 20 to 26 million maters.

For many GPS receivers, the most significant effect to account for is the receiver clock offset. This is the difference between the receivers internal time and true GPS time. This parameter is often computed as part of a PVT solution. This is not how reszilla works. Reszilla is provided a surveyed position of the receiver antenna, and it makes a more accurate estimate of the receiver clock offset by averaging the residuals of all SVs in track.

#### 2.34.3 Usage

## OrdApp

OrdApp					
Required A	Arguments				
Short Arg.	Long Arg.	Description			
-i	-input	Where to read the ord data. The default is stdin.			
-r	-output	Where to write the output. The default is stdout.			
-t	-time-format	CommonTime format specifier used for times in the output.			
Optional Arguments					
Short Arg.	Long Arg.	Description			
	-ns	Report the clock in ns, not meters.			

2.34. RESZILLA 61

## ordClock

ordClock generates clock estimates for each epoch of ORDs.

ordClock						
Optional Arguments						
Short Arg.	Long Arg.	Description				
-d	-debug	Increase debug level.				
-v	-verbose	Increase verbosity.				
-h	-help	Print help usage.				
-w	-use-warts	Use warts in the clock solution. The default is				
		to not use warts.				
-e	-estimate-only	Only compute the receiver clock bias. Don't				
		remove this bias from the ords. The default is to				
		both estimate the bias and remove the it from				
		the ords.				
-c	-clock-source=ARG	An ord file to read the receiver clock offsets				
		from.				
-i	-input = ARG	Where to read the ord data. The default is				
		stdin.				
-r	-output = ARG	Where to write the output. The default is				
		stdout.				
-t	-time-format = ARG	CommonTime format specifier used for times in				
		the output. The default is "%4Y %3j				
		%02H:%02M:%04.1f".				
	-ns	Report the clock in ns, not meters.				

## ordEdit

 $\mathit{ordEdit}$ edits an ORD file based on various criteria.

ordEdit					
Optional Arguments					
Short Arg.	Long Arg.	Description			
-d	-debug	Increase debug level.			
-v	-verbose	Increase verbosity.			
-h	-help	Print help usage.			
-k	-clock-est	Remove ORDs that do not have corresponding			
		clock estimates.			
-c	-no-clock	Remove all clock offset estimate warts. Give			
		this option twice to remove all clock data.			
-m	-elev=NUM	Remove data for SVs below a given elevation			
		mask.			
-p	-PRN=NUM	Filter data by PRN number. Repeat option for			
		multiple satellites. Negative PRN numbers			
		mean exclude these PRNs. Positive PRN			
		numbers mean only include these satellites. Zero			
		removes all.			
-w	-warts=NUM	Include/Exclude warts from the indicated PRN.			
		Repeat option for multiple PRNs. Negative			
		numbers exclude, positive numbers include, zero			
		excludes warts from all PRNs. The default is to			
		include all warts.			

-e	-be-file=ARG	Remove data for unhealthy SVs by providing broadcast ephemeris source: RINEX nav or FIC file.
	-start $=$ ARG	Throw out data before this time. Format as string: "yyyy ddd HH:MM:SS".
	-end $=$ ARG	Throw out data after this time. Format as string: "yyyy ddd HH:MM:SS".
-S	-size = ARG	Remove clock residuals with absolute values greater than this size (meters).
-1	-ord-limit=ARG	Remove ords with absolute values greater than this size (meters).
-i	-input=ARG	Where to read the ord data. The default is stdin.
-r	-output = ARG	Where to write the output. The default is stdout.
-t	-time-format = ARG	CommonTime format specifier used for times in the output. The default is "%4Y %3j %02H:%02M:%04.1f".
	-ns	Report the clock in ns, not meters.

## ord Gen

ordGen generates observed range deviations.

		ordGen
Required	Arguments	
Short Arg.	Long Arg.	Description
-O	-obs=ARG	Where to get the obs data.
-e	-eph=ARG	Where to get the ephemeris data. Acceptable
		formats include RINEX (nav), FIC, MDP, SP3,
		YUMA, and SEM.
Optional	Arguments	
Short Arg.	Long Arg.	Description
-d	-debug	Increase debug level.
-v	-verbose	Increase verbosity.
-h	-help	Print help usage.
-w	-weather $=$ ARG	Weather data file name (RINEX met format
		only).
-c	-msc = ARG	Station coordinate file.
	-omode=ARG	Specifies what observations are used to compute
		the ORDs. Valid values are:p1p2, z1z2, c1p2,
		c1c2, c1y2, c1z2, y1y2, c1, p1, y1, z1, c2, p2, y2,
		z2, smo, dynamic, and smart. The default is
		smart.
	-trop-model=ARG	Specify the trop model to use. Options are zero,
		simple, nb, and gg. The default is nb.
-p	-pos=ARG	Location of the antenna in meters ECEF.
-m	-msid=NUM	Station to process data for. Used to select a
		station position from the msc file or data from a
		SMODF file.
-n	-near	Allows the program to select an ephemeris that
		is not strictly in the future. Only affects the
		selection of which broadcast ephemeris to use.
	-sv-time	Assume that the data is time-tagged according
		to each SV's clock, not a common receiver clock.
		The is set by default only for omode=smo.

2.34. RESZILLA 63

-i	-input = ARG	Where to read the ord data. The default is
		stdin.
-r	-output = ARG	Where to write the output. The default is
		stdout.
-t	-time-format = ARG	CommonTime format specifier used for times in
		the output. The default is "%4Y %3j
		%02H:%02M:%04.1f".
	-ns	Report the clock in ns, not meters.

# ordLinEst

ordLinEst computes a linear clock estimate.

ordLinEst						
Optional A	Arguments					
Short Arg.	Long Arg.	Description				
-d	-debug	Increase debug level.				
-v	-verbose	Increase verbosity.				
-h	-help	Print help usage.				
-m	-max-rate = ARG	Rate used to detect a clock jump. Default is				
		10,000  m/day.				
-i	-input = ARG	Where to read the ord data. The default is				
		stdin.				
-r	-output = ARG	Where to write the output. The default is				
		stdout.				
-t	-time-format = ARG	CommonTime format specifier used for times in				
		the output. The default is "%4Y %3j				
		%02H:%02M:%04.1f".				
	-ns	Report the clock in ns, not meters.				

## ordStats

ordStats computes ORD statistics.

		ordStats
Optional A	Arguments	
Short Arg.	Long Arg.	Description
-d	-debug	Increase debug level.
-v	-verbose	Increase verbosity.
-h	-help	Print help usage.
-b	-elev-bin=ARG	A range of elevations, used in computing the
		statistical summaries. Repeat to specify
		multiple bins. The default is "-b 0-10 -b 10-20
		-b 20-60 -b 10-90".
-s	-sigma=NUM	Multiplier for sigma stripping used in statistical
		computations. The default value is 6.
-w	-wonky	Use wonky data in stats computation. The
		default is to not use such data.

	-stats-only	Only output stats to stdout.
-i	-input = ARG	Where to read the ord data. The default is
		stdin.
-r	-output $=$ ARG	Where to write the output. The default is
		stdout.
-t	-time-format = ARG	CommonTime format specifier used for times in
		the output. The default is "%4Y %3j
		%02H:%02M:%04.1f".
	-ns	Report the clock in ns, not meters.

#### 2.34.4 Double Difference Residuals

While many double differences exist, reszilla computes an the first difference to a master SV and the second difference to a second receiver. This double difference removes receiver clock error, iono, trop, and SV clock errors. When the two receivers are connected to a common antenna (often referred to as a zero-baseline setup) and are of the same type, even the multipath is differenced out. What is left is basically receiver tracking noise and receiver tracking errors.

One complicating factor in computing this DD is that while the clock errors in the receivers cancel out, there is still an error associated with the motion of the satellite during the interval between when the two receivers computing their observation. To remove this error, an estimate of the clock offset between the two receivers is need. Reszilla can get this estimate in one of two ways; estimates this by computing a clock estimate for each receiver as described under the ORD section or reading the estimates from the rinex obs data files. These two estimates are then differenced to get the offset between the two receivers.

Another complicating factor is that the phase observations normally have an "integer ambiguity" associated with them. When the DD phase observation is computed, it will have the difference between the two receivers ambiguity. Often this number can be quite big. Removing this ambiguity is often referred to as debiasing the data. This process involves much black magic and slight of hand. Do not delve into this or even look too closely at the details or you will be sullied.

#### 2.34.5 Usage

#### ddGen

ddGen computes double-difference residuals from raw observations.

		ddGen
Required A	Arguments	
Short Arg.	Long Arg.	Description
-1	-obs1=ARG	Where to get the first receiver's obs data.
-2	-obs2 = ARG	Where to get the second receiver's obs data.
-e	-eph=ARG	Where to get the ephemeris data. Acceptable
		formats include RINEX nav, FIC, MDP, SP3
		YUMA, and SEM.

2.34. RESZILLA 65

-	l Arguments	Description
Short Arg	g. Long Arg. –debug	Description Increase debug level.
-a -v	-aebug -verbose	Increase debug level. Increase verbosity.
		·
-h	$-\mathrm{help}$ $-\mathrm{ddmode}{=}\mathrm{ARG}$	Print help usage.  Specifies what observations are used to compute
	-dumpe-Aivo	Specifies what observations are used to compute the double difference residuals. Valid values are: all, phase. The default is all.
	-omode=ARG	7.
	Ullioqu-111	Specifies what observations to use to compute the ORDs. Valid values are: p1p2, z1z2, c1p2, c1y2, c1z2, y1y2, c1, p1, y1, z1, c2, p2, y2, z2 smo, dynamic, and smart. The default is smart.
	-min-arc-time = ARG	The minimum length of time (in seconds) that a sequence of observations must span to be considered as an arc. The default value is 60.0
	-min-arc-gap=ARG	seconds. The minimum length of time (in seconds) between two arcs for them to be considered separate arcs. The default value is 60.0 seconds.
	-min-arc-length=ARC	•
	-noise=ARG	The noise threshold used in finding discontinuitites. The default is 0.1000 cycles.
-b	-elev-bin=ARG	Range of elevations to use in computing the statistical summaries. Repeat to specify multiple bins. The default is "-b 0-10 -b 10-20 -b 20-60 -b 10-90".
-c	-msc = ARG	Station coordinate file.
-p	-pos=ARG	Location of the antenna in meters ECEF.
-E	-health-src=ARG	Do not use data from unhealthy SVs as determined using this ephemeris source. Can be RINEX navigation or FIC file(s).
	-strip=ARG	Factor used in stripping data prior to computing descriptive statistics. The default value is 3.2.
	-phase=ARG -S	Only compute phase double differences. Only included observables with a raw signal strength, or SNR, of at least this value, in dB
	-msid=NUM	Station to process data for. Used to select a station position from the msc file or data from a SMODF file.
	-window=NUM	Compute mean values of the double differences over this time span (seconds). (15 min = 900)
	-raw	Output the raw double differences in addition to the descriptive statistics.
	-all-combos	Compute all combinations, don't just use one master SV.
-n	-near	Allow the program to select an ephemeris that is not strictly in the future. Only affects the selection of which broadcast ephemeris to use. i.e. use a close ephemeris.
	-zero-trop	Disables trop corrections.

#### 2.34.6 Data Input

Several different types of data are required to compute these residuals; the raw observations, the receiver antenna position, the satellite position, and optionally weather observations. The raw observations may be supplied to reszilla in one of several formats; rinex obs (see RinexObsData class), smodf (see SMODFData class), and MDP (see MDPObsEpoch class in apps/MDPtools). The receiver antenna postion may be specified in the rinex obs header or via a station coordinates file (see MSCData class).

### 2.34.7 Output

There are two general types of output that reszilla produces - statistical summaries and the raw residuals. The mean, standard deviation, and maximum value of the residuals are calculated as a function of specified elevation ranges and are output in a statistics table. Looking at the results for each elevation bin is useful as ORDs tend to be much a higher when satellites are lower on the horizon. For a more thorough analysis, the ORD or DD residuals calculated by reszilla may be output in a matrix format to a file with columns for time, PRN, elevation, ORD or clock residual, IODC, satellite health, and a flag for the residual type. The flag specifies exactly which of the 13 possible residual types the data on that row represent, depending on the method used for calculation.

One benefit of this output feature is that residuals can be looked at for particular time periods or PRNs. Fortunately there is a companion plotting tool that makes this simple. Given a reszilla output file, the dplot program will plot residuals and, if specified, receiver clock estimates versus time using gnuplot. A user may specify the time range, stripping value, and PRN(s) to use in the plot, as well as a filename for saving the result.

## 2.34.8 Notes

The criteria min-arc-time and min-arc-length are both required to be met for a arc to be valid in double difference mode. All output quantities (stddev, min, max, ord, clock, double difference, ...) are in meters.

## 2.35 rmwcheck rnwcheck rowcheck

#### 2.35.1 Overview

These applications read a RINEX observation (rowcheck), navigation(rnwcheck), or meteorological (rmwcheck) data file and check it for errors.

### 2.35.2 Usage

#### Optional Arguments

Optional 1	ii Saimonos	
Short Arg.	Long Arg.	Description
-d	-debug	Increase debug level.
-v	-verbose	Increase verbosity.
-h	-help	Print help usage.
-l	-quit-on-first-error	Quit on the first error encountered.
-t	-time = TIME	Time of first record to count (Default $=$ BOT).
-e	-end-time=TIME	End of time range to compare (Default = $EOT$ ).

rmwcheck usage: rmwcheck [options] <RINEX Met file>rnwcheck usage: rnwcheck [options] <RINEX Nav file>rowcheck usage: rowcheck [options] <RINEX Obs file>

## 2.35.3 Examples

```
> rnwcheck -t "08/01/2006 12:00:00" -e "08/01/2006 15:00:00" s081214a.99n
```

Checking s081213a.99n Read 200 records.

#### 2.35.4 Notes

Only the first error in each file is reported. The entire file is always checked regardless of time options.

## 2.36 rmwdiff rnwdiff rowdiff

#### 2.36.1 Overview

These applications difference RINEX observation, navigation, and meteorological data files.

### 2.36.2 Usage

#### **Optional Arguments** Short Arg. Long Arg. Description -debug Increase debug level. -d -verbose Increase verbosity. -h -helpPrint help usage. $-quit\hbox{-on-first-error}$ -l Quit on the first error encountered. $-time{=}TIME$ Start of time range to compare (Default = BOT.) -end-time=TIME End of time range to compare (Default = EOT.)

```
rmwdiff usage: rmwdiff [options] <RINEX Met file> <RINEX Met file> rnwdiff usage: rnwdiff [options] <RINEX Nav file> <RINEX Nav file> rowdiff usage: rowdiff [options] <RINEX Obs file> <RINEX Obs file>
```

#### 2.36.3 Notes

Only the first error in each file is reported. The entire file is always checked regardless of time options.

## 2.37 RinexDump

#### 2.37.1 Overview

The application reads a RINEX file and dumps the obervation types in columns. Output is to the screen, with one time tag and one satellite per line.

## 2.37.2 Usage

RinexDump			
Optional A	rguments		
Short Arg.	Long Arg.	Description	
	-pos	Output only positions from aux headers; sat and	
		obs are ignored.	
-n	-num	Make output purely numeric (no header, no	
		system char on sats).	
	-format < file >	Output times in CommonTime format (Default:	
		%4F %10.3g).	
	-file <file></file>	RINEX observation file; this option may be	
		repeated.	
	-obs < obs >	RINEX observation type, found in file header.	
	-sat < sat >	RINEX satellite ID (e.g. G31 for GPS PRN 31).	
-h	-help	Print this and quit.	

RinexDump usage: RinexDump [-n] <rinex obs file> [<satellite(s)> <obstype(s)>]

The optional argument -n tells RinexDump its output should be purely numeric.

#### 2.37.3 Examples

```
> RinexDump algo1580.060 3 4 5

                                                  18.600 0 0
```

## 2.37.4 Notes

MATLAB and Octave can read the purely numeric output.

## $2.38 \quad Rinex 3 Dump$

## 2.38.1 Overview

The application reads a RINEX3 file and dumps the obervation data for the given satellite(s) to the standard output.

## 2.38.2 Usage

		Rinex3Dump
Optional A	rguments	
Short Arg.	Long Arg.	Description
-f	-file <file></file>	Input file is a RINEX observation file. This option may be repeated. Optional, but may be needed in case of ambiguity.
	-format <format></format>	The format of the time output. Default is $\%4F$ $\%10.3g$ .
-h	-help	Prints out this help and exits.
-n	-num	Make output purely numeric, ie. no header, no system char on satellites.
-O	-obs <obs></obs>	RINEX observation type (eg. C1C) found in the file header. Optional, but may be needed in case of ambiguity.
-p	-pos	Only output positions from aux headers, ie. sat and obs are ignored.
-S	-sat <sat></sat>	RINEX satellite ID (eg. For GPS PRN 31, <sat> = G01). Optional, but may be needed in case of ambiguity.</sat>
-v	-verbose	Prints out verbose output.

Rinex3Dump usage: Rinex3Dump [-n] <rinex obs file> [<satellite(s)> <obstype(s)>]

The optional argument  $\neg n$  tells Rinex3Dump its output should be purely numeric.

## 2.38.3 Notes

MATLAB and Octave can read the purely numeric output.

2.39. RINEXPVT 71

## $2.39 \quad rinexpvt$

## 2.39.1 Overview

The application generates a user position based on RINEX observation data with the option of including navigation and meteorological data to aid error correction.

## 2.39.2 Usage

		rinexpvt
Required A	rguments	
Short Arg.	Long Arg.	Description
-O	-obs-file=ARG	RINEX observation file.
Optional A	rguments	
Short Arg.	Long Arg.	Description
-d	-debug	Increase debug level.
-v	-verbose	Increase verbosity.
-h	-help	Print help usage.
-n	-nav-file=ARG	RINEX navigation file. Required for single
		frequency ionosphere correction.
-p	-pe-file=ARG	SP3 Precise Ephemeris file. Repeat this for each
-	•	input file.
-m	-met-file=ARG	RINEX meteorological file.
-t	-time-format = ARG	Alternate time format string.
-e	-enu=ARG	Use the following as origin to solve for
		East/North/Up coordinates, formatted as a
		string: "X Y Z".
-l	-elevation-mask=ARG	Elevation mask (degrees).
-g	-logfile=ARG	Write logfile to this file.
-r	-rate=ARG	Observation interval (Default $= 30$ seconds or
		Rinex Header specification).
-y	-yuma=ARG	Yuma almanac file.
-a	-sem=ARG	SEM almanac file.
-s	-single-frequency	Use only C1 (SPS).
-f	-dual-frequency	Use only P1 and P2 (PPS).
-i	-no-ionosphere	Do NOT correct for ionosphere delay.
-x	-no-closest-ephemeris	Allow ephemeris use outside of fit interval.
-c	-no-carrier-smoothing	Do NOT use carrier phase smoothing.
-z	-no-glonass	Exclude GLONASS Satellites from PVT
	-	solution.

## 2.39.3 Examples

```
> rinexpvt -o arl2800.06o -n arl2800.06n
2006 1 1 09 41 00 918130.968492 -4346073.94224 4561982.02123 333.303358692
2006 1 1 09 41 30 918130.956684 -4346073.91529 4561982.01659 333.317002144
2006 1 1 09 42 00 918130.924146 -4346073.83279 4561982.01338 333.279239604
```

## 2.39.4 Notes

Though not stated in the required options lists, either a RINEX navigation file or an SP3 Precise Ephemeris File is needed, using the -n or -p option respectively. When using precise ephemeris, three files must be included: the previous day, the current day, and the next day.

Although -z argument appears as optional, in this release, it is always turned on, but implementation will occur in a later release.

2.40. RINSUM 73

## 2.40 RinSum

#### 2.40.1 Overview

The application reads a RINEX file and summarizes it content.

### 2.40.2 Usage

RinSum		
Optional A	rguments	
Short Arg.	Long Arg.	Description
-i	-input	Input file name(s).
-f		File containing more options.
-O	-output	Output file name.
-p	-path	Path for input file(s).
-R	-Replace	Replace header with full one.
-S	-sort	Sort the PRN/Obs table on begin time.
-g	-gps	Print times in the PRN/Obs table as GPS
		times.
	-gaps	Print a table of gaps in the data, assuming specified interval dt.
	-start	Start time: <time> is 'GPSweek,sow' OR 'YYYY,MM,DD,HH,Min,Sec'.</time>
	-stop	Stop time: <time> is 'GPSweek,sow' OR 'YYYY,MM,DD,HH,Min,Sec'.</time>
-b	-brief	Produce a brief (6-line) summary.
-h	-help	Print syntax and quit.
-d	-debug	Print debugging information.

### 2.40.3 Examples

```

## 2.42 rtAshtech

## 2.42.1 Overview

This application logs observations from an Ashtech Z-XII receiver. It records observations directly into the RINEX format. A number of optional outputs are possible. The raw messages from a receiver can be recorded. Observations can also be recorded in a format that is easily imported into numerical packages.

## 2.42.2 Usage

rtAshtech			
Optional A	Arguments		
Short Arg.	Long Arg.	Description	
-h	-help	Print help usage.	
-v	-verbose	Increased diagnostic messages.	
-r	-raw	Record raw observations.	
-l	-log	Record log entries.	
-t	-text	Record observations as simple text files.	
-O	-rinex-obs=ARG	Naming convention for RINEX obs files.	
-n	-rinex-nav=ARG	Naming convention for RINEX nav message	
		files.	
-T	-text-obs = ARG	Naming convention for obs in simple text files.	
-i	-input	Where to read ashTech data. Can be a file or a	
		serial device (ser:/dev/ttyS0), a tcp port	
		(tcp:hostname:port), or standard input (the	
		default).	

## 2.42.3 Examples

```
> rtAshtech -p /dev/ttyS1
```

> rtAshtech -o "minute\%03j\%02H\%02M.\%02yo"

### 2.42.4 Notes

rtAshtech only works on UNIX systems with POSIX compliant serial ports.

2.43. SP32BC 77

# 2.43 sp32bc

## 2.43.1 Overview

This application reads an SP3 file (either a or c format) and writes to RINEX navigation file(s).

## 2.43.2 Usage

		sp32bc
Required A	Arguments	
Short Arg.	Long Arg.	Description
-p	-pe	Input precise ephemeris.
-r	$-\mathbf{r}$	Rate of broadcast ephemeris output (seconds).
Optiona	d Arguments	
Short Arg.	Long Arg.	Description
-h	-help	Display argument list.

# $2.44 \quad sp3version$

## 2.44.1 Overview

This application reads an SP3 file (either a or c format) and writes it to another file (also either in a or c format).

## 2.44.2 Usage

sp3version				
Optional A	Arguments			
Short Arg.	Long Arg.	Description		
	-in	A file from which to take the input. The default		
		is stdin.		
	-out	A file into which to write the output. The		
		default is sp3.out.		
	-output $C$	Output version c (otherwise a).		
	-msg	Add message as a comment to the output		
		header.		
	-verbose	Output to screen: dump headers, data, etc.		

2.45. SVVIS 79

## $\boldsymbol{2.45} \quad \boldsymbol{svvis}$

## 2.45.1 Overview

This application computes when satellites are visible at a given point on the earth.

## 2.45.2 Usage

Required A Short Arg.	Arguments Long Arg. –eph=ARG	Description Where to get the ephemeris data. Can be RINEX, nav, FIC, MDP, SP3, YUMA, and SEM.
Optional A	rguments	
Short Arg.	Long Arg.	Description
-d	-debug	Increase debug level.
-v	-verbose	Increase verbosity.
-h	-help	Print help usage.
	-elevation-mask=ARG	The elevation above which an SV is visible. The default is 0 degrees.
-p	-position=ARG	Receiver antenna position in ECEF (x,y,z) coordinates. Format as string: "X Y Z".
-c	-msc = ARG	Station coordinate file.
-m	-msid = ARG	Station number to use from the msc file.
	-graph-elev=ARG	Output data at the specified interval. Interval is in seconds.
-l	-time-span=ARG	How much data to process, in seconds. Default is 86400.
	-start-time $=$ TIME	When to start computing positions. The default is the start of the ephemeris data.
	-stop-time=TIME	When to stop computing positions. The default is one day after the start time.
	-print-elev	Print the elevation of the sv at each change in tracking. The default is just to outut the PRN of the SV.
	-rise-set -tabular -recent-eph	Print the visibility data by PRN in rise-set pairs. Print the visibility data in a tabular format. Use this if the ephemeris data provided uses 10-bit GPS weeks and it should be converted to the current epoch or to the epoch current to the "start-time", if specified.

## $2.46 \quad TECMaps$

### 2.46.1 Overview

Program TECMaps reads RINEX data files containing extended RINEX observation types EL, AZ and SR or VR from several sites and at each epoch fits the vertical TEC data to a model of the ionosphere on a two-dimensional grid surface. Hardware TEC measurement biases are corrected, using input from the program IonoBias. The user can specify the type of grid, the type of TEC data and the model to be used. Output is in the form of files, one per epoch, which can be used to plot the 2D ionospheric TEC surface.

#### 2.46.2 Usage

TECMaps

Required Arguments

Short Arg. Long Arg. Description

-input Input RINEX obs file name(s).

**Optional Arguments** 

Short Arg. Long Arg. Description

-f File containing more options.

Reference Station Position (One Required)

Short Arg. Long Arg. Description

-RxLLH <1,1,h> Reference site position in geodetic lat, lon (E),

ht (deg, deg, m).

-RxXYZ < x,y,z> Reference site position in ECEF coordinates

(m).

-inputdir Path for input file(s).

Ephemeris Input

Short Arg. Long Arg. Description

-navdir Path of navigation file(s).

-nav Navigation (RINEX navigation OR SP3) file(s).

Output

Short Arg. Long Arg. Description

-log Output log file name.

Time Limits

Short Arg. Long Arg. Description

-BeginTime Start time, arg is of the form YYYY,MM,DD,HH,Min,Sec.

-BeginGPSTime Start time, arg is of the form GPSweek,GPSsow.

-EndTime End time, arg is of the form YYYY,MM,DD,HH,Min,Sec.

-EndGPSTime End time, arg is of the form GPSweek,GPSsow.

Processing

Short Arg. Long Arg. Description

-noVTECmap
-MUFmap
-F0F2map

Do NOT create the VTEC map.
Create MUF map as well as VTEC map.
Create F0F2 map as well as VTEC map.

2.46. TECMAPS 81

	-Title1 < title> -Title2 < title> -BaseName < name> -DecorrError < de> -Biases < file>  -ElevThresh < ele> -MinAcqTime <t> -FlatFit -LinearFit -IonoHeight &lt; n&gt; -Offset &lt; tec&gt;</t>	Title information. Second title information. Base name for output files. Decorrelation error rate in TECU/1000km (3). File containing estimated sat+rx biases (Prgm IonoBias). Minimum elevation (6 degrees). Minimum acquisition time (0 seconds). Flat fit type (default). Linear fit type. Ionosphere height (km). Overall bias to add to data (TECU).
Grid

Help Short Arg. -v -d -h	Long Arg.  -verbose  -debug  -help	Description Print extended output info. Increase debug level. Print syntax and summary of input, then quit.

## 2.46.3 Notes

Input is on the command line, or of the same format in a file (-f<file>).

## $2.47 \quad time convert$

#### 2.47.1 Overview

This application allows the user to convert between time formats associated with GPS. Time formats include: civilian time, Julian day of year and year, GPS week and seconds of week, Z counts, and Modified Julian Date (MJD).

## 2.47.2 Usage

time convert						
Optional Arguments						
Short Arg.	Long Arg.	Description				
-d	-debug	Increase debug level.				
-v	-verbose	Increase verbosity.				
-h	-help	Print help usage.				
-A	-ansi=TIME	"ANSI-Second".				
-c	-civil=TIME	"Month(numeric) DayOfMonth Year				
		Hour:Minute:Second				
-R	-rinex-file=TIME	"Year(2-digit) Month(numeric) DayOfMonth				
		Hour Minute Second".				
-O	-ews=TIME	"GPSEpoch 10bitGPSweek SecondOfWeek".				
-f	-ws=TIME	"FullGPSWeek SecondOfWeek".				
-w	-wz=TIME	"FullGPSWeek Zcount".				
	-z29=TIME	"29bitZcount".				
$-\mathbf{Z}$	-z32=TIME	"32bitZcount".				
-j	-julian $=$ TIME	"JulianDate".				
-m	-mjd=TIME	"ModifiedJulianDate".				
-u	-unixtime = TIME	"UnixSeconds UnixMicroseconds".				
-y	-doy=TIME	"Year DayOfYear SecondsOfDay".				
	-input-format = ARG	Time format to use on input.				
	-input-time=ARG	Time to be parsed by "input-format" option.				
-F	-format = ARG	Time format to use on output.				
-a	-add-offset= $NUM$	Add NUM seconds to specified time.				
-S	-sub-offset=NUM	Subtract NUM seconds from specified time.				

## 2.47.3 Examples

#### Convert RINEX file time.

Zcount: 29-bit (32-bit) 186122573 (1259864397)

## 2.47.4 Notes

If no arguments are given it will convert the current time to all formats. When inputting time values, include quotation marks.

#### 2.48 vecsol

### 2.48.1 Overview

The application computes a 3D vector solution using dual-frequency carrier phases. A double difference algorithm is applied with properly computed weights (elevation sine weighting) and correlations. The program iterates to convergence and attempts to resolve ambiguities to integer values if close enough. Crude outlier rejection is provided based on a triple-difference test. Ephemerides used are either broadcast or precise (SP3).

Alternatively, P code processing is additionally provided. The solution is computed using either the ionosphere-free linear combination, or the average of L1 and L2. The ionospheric model included in broadcast ephemeris may be used. A standard tropospheric correction is applied, or tropospheric parameters (zenith delays) may be estimated for the first station (vector mode) or both.

#### 2.48.2 Usage

vecsol usage: vecsol <RINEX Obs file 1> <RINEX Obs file 2>

#### **RINEX Observation Files**

The two arguments are names of RINEX observation files. They contain the observations collected at the two end points 1 and 2 of the baseline. They must contain a sufficient set of simultaneous observations to the same satellites.

If no separate station coordinate files are provided, the initial station coordinates are taken from the RINEX headers. Upon finishing, vecsol creates or updates the coordinate file of the first station (vector mode) or both.

### Configuration File vecsol.conf

The file vecsol.conf contains the input options for the program, one per line.

Options	Value	Meaning
obsMode	3/2/1/0	If 1 or 3, process carrier phase data (instead of
		P code data). If 0 or 1, iterate on
		ionosphere-free vector (not $L1 + L2$ ).
truecov	1/0	If 1, use true double difference covariances. If 0,
		ignore any possible correlations.
precise	1/0	If 1, use precise ephemeris, if 0, use broadcast
		ephemeris.
iono	1/0	If 1, use the 8-parameter ionospheric model that
		comes with the broadcast ephemeris (.nav) files.
tropo	1/0	If 1, estimate troposphere parameters (zenith
		delays relative to the standard value, which is
		always applied).
vecmode	1/0	If 1, solve the vector, i.e. the three coordinate
		differences between the baseline end points. If 0,
		solve for the absolute co-ordinates of both end
		points.
debug	1/0	If 1, produce lots of gory debugging output. See
Ü	,	the source for what it all means.

2.48. VECSOL 85

number Minimum elevation (degs) of the reference refsat elev satellite used for computing inter-satellite differences. Good initial choice: 30.0. cutoff elev number Cut-off elevation (degs). Good initial choice: 10.0 - 20.0. rej TP, rej TC Phase, code triple differences rejection limit (m). two numbers reduce 1/0Apply post-reduction to combine dependent unknowns.

#### **Ephemeris File Lists**

The file vecsol.nav contains the names of the navigation RINEX files ("nav files", extension). Good navigation RINEX files that are globally valid can be found from the CORS website at http://www.ngs.noaa.gov/CORS/.

The file vecsol.eph contains the names of the precise ephemeris SP3 files (extension .sp3) to be used. These should cover the time span of the observations, with time to spare on both ends. Note that the date in the filenames of the SP3 files is given as GPS week + weekday, not year + day of year, as in the observation and nav files.

In the .nav and .eph files, comment lines have # in the first position.

## 2.48.3 Notes

Currently, vecsol does not recover from cycle slips, so the RINEX observation files used have to be fairly clean.

## $2.49 \quad Where Sat$

#### 2.49.1 Overview

This application uses input ephemeris to compute the predicted location of a satellite. The Earth-centered, Earth-fixed (ECEF) position of the satellite is reported. Optionally, the topocentric coordinates—azimuth, elevation, and range—can be generated. The user can specify the time interval between successive predictions. Also the output can generated in a format easily imported into numerical packages.

## 2.49.2 Usage

Where Sat						
Required	Arguments	Witten				
Short Arg.	Long Arg.	Description				
-e	-eph-files=ARG	Ephemeris source file(s). Can be RINEX nav, SP3, or FIC.				
Optional Arguments						
Short Arg.	Long Arg.	Description				
-h	-help	Print help usage.				
-u	-position=ARG	Antenna position in ECEF (x,y,z) coordinates.				
		Format as string: "X Y Z". used to give				
		user-centered data (SV range, azimuth, and				
		elevation) when SV is in view.				
	-start $=$ ARG	Ignore data before this time. Format as string:				
		"MO/DD/YYYY HH:MM:SS".				
	-end=ARG	Ignore data after this time. Format as string: "MO/DD/YYYY HH:MM:SS".				
-f	-time-format=ARG	CommonTime format specifier used for times in				
•		the output. The default is "%4Y %3j				
		%02H:%02M:%4.1f".				
-p	-prn=NUM	Which SVs to analyze. Repeat option for				
r	P	multiple satellites. If this option is not specified,				
		all ephemeris data will be processed.				
-t	-time=NUM	Time increment in seconds for ephemeris				
		calculation. Default is 900 seconds (15 minutes).				

## 2.49.3 Examples

```
> WhereSat -b aira1720.06n -p 2 -u "918129.01 -4346070.45 803.18"
-s "06/21/2006 17:00:00" -e "06/21/2006 20:00:00" -t 1800

Antenna Position: 918129 -4.34607e+06 803.18
Navigation File: aira1720.06n
Start Time: 06/21/2006 17:00:00
End Time: 06/21/2006 20:00:00
PRN: 2
Prn 2 Earth-fixed position and clock information:
Date Time(UTC) X (meters) Y (meters) Z (meters)
```

2.49. WHERESAT

Calculated 4 increments for prn 2 .
